

The DNA Compass

Quantum Entanglement's Irreducible Complexity Within the Self-Replicating DNA's Fractal Antenna

"In a nutshell the DNA replicates itself" – Craig Venter, Director NHGRI

The self-replicating DNA genetic code blueprint cannot evolve and change at the same time; the whole function of the DNA code is to prevent the biological metamorphoses from one kind into another kind from ever happening. "Insanity is doing the same thing over and over again and expecting different results." – Albert Einstein. The DNA is not a lifeform in of itself but contains all the necessary information to construct and support the lifeform. The lifeform or organism exists because of the self-replicating DNA and the DNA exists because of the reproducing lifeform, one cannot exist without the other. The whole is not greater than the sum of all its constituent parts, the microscopic quantum super computer within the nucleus of every cell in your body is the most sophisticated on earth, and cannot be rivaled by manmade artificial intelligence made in the image of man himself. Now a self-declared creator in defiance of his own creator, quantum super computers are created and programmed to replicate themselves. This type of sophisticated technology can only be achieved with human help. Irreducible complexity makes it physically impossible for the DNA to replicate itself and evolve at the same time because evolution demands change. Changes within the DNA occur in the form of mutations manifesting cancer, deformities, disease and death. Mutations breakdown the organism's ability to carry on life, as a result changes in the DNA do not produce constructive life giving benefits to the organism. The DNA replicates itself in order to perpetuate its own kind. Like begets like, a dog is a dog is a dog and a chicken is a chicken. What then evolved first? The DNA? The chicken or the egg? First, the chicken is hatched out of an egg laid by a fully formed adult hen that's fertilized by a fully formed adult rooster who passes on his fully formed genetics stored deep within his fully functioning DNA code. To assume it took a long period of time, chance and mutations for irreducible complexity of the self-replicating DNA to evolve into a chicken; how then does Darwin's Origin of Species explain the first fully formed hen and rooster to originate in the first place? All the numerous necessary components of an organism must be fully present and functioning within the DNA code for fertilization, meiosis, birth and development into adulthood to occur. It is categorically wrong to assume that chickens evolved from the Tyrannosaurus Rex. Chicken species can only reproduce more chickens, as many different varieties as there may be, chickens will always be chickens because chicken DNA replicates itself. Now that the chickens have come home to roost, Jacob's ladder winds up to Heaven like a spiral staircase leading us back to where we started, Genesis documenting the origin of all life. The infinitely complex and perfectly precise double helix DNA-RNA nucleotide generating-zipper sequence is perhaps the greatest discovery in the history of mankind. The self-replicating DNA's genetic code contains all the necessary details and information composing a living organism all packed into a teeny tiny little macro molecule wound up around itself in four basic bases of nucleotides. These four basic building blocks **adenine** and **thymine**, **cytosine** and **guanine** lock and unlock a corresponding sequence of four sets of triplets – base – sets of codons; sixty four codonic arrangements of elemental sets generate the genetic code 4^3 metric. Beyond time and chance, the genetic interlocking sequence must be fully completed before the next transcriptional sequence can begin. Any mutational changes within the genetic code during transcription is automatically seen as an editorial error to be corrected or rejected, otherwise the sequence ceases to continue and chaos within the cell will likely evolve into a cancerous tumor or deformity. Astonishingly complex bio-electromagnetic-chemical processes occurring within our bodies replicate in lightning quick liquid-light nanoseconds. Out with the old, in with the new, our bodies are completely renewed and regenerated many times over in the span of our lifetime. Evolutionary subjective time is not the magic wand solving the biological question of irreducible complexity. Once subjective time versus objective time is observed and revealed, the curtain is drawn back and evolution theory becomes nothing more than a piece of holly wood thrown into the fire where it burns up in no time at all. Because our objective present time is real and not a subjective theory, we can reverse engineer the present into the past only to observe that the present is the key to understanding both our past, present and future. As time keeps on slipping into the future, all living organisms continue to perpetuate their own kind without a single exception. When enough people believe in a past that never actually happened, a consequential phenomena of the Mandala effect manifests artificial evolution=noi-tu-love in the form of irreversible **Genetically Modified Organisms** posing an existential threat to all natural organic life on Earth. Because all life on Earth is precisely calibrated and aligned with Earth's magnetosphere, the DNA acts as a fractal antenna regulating quantum entanglement's irreducible complexity of hereditary transmission, orientation, equilibrium, coordination, regeneration, homeostasis, intuition, consciousness, conscience and spiritual awareness. Water, being liquid light, $E=MC^2$ is the basis of all life on Earth. Being 88% water, our bodies align with the Earth's magnetosphere. Water, a clear liquid compound of two parts hydrogen and one part oxygen, is essential for all life. Ocean water is the most prolific substance on Earth; since our bodies are

mostly composed of water (similar to sea water) and H₂O being hydrogen-positive and oxygen-negative spontaneously positive and negative is automatically calibrated for our equilibrium and balance; six-sided-hexagonal-honeycombed-clustered-water-snowflake-shaped H₂O molecules bond and resonate with the double-helix-spiral-structure of the DNA/RNA where one form of energy is converted into another. Cellular DNA/RNA acts as an electromagnetic energy receiver and transmitter of information to replicate itself: The superconductive energy for this spontaneous alternating reciprocal transduction is within H₂O's fluid properties and negatively charged hydrogen electrons power of attraction and repulsion; virtually every physical function including memory is regulated by this vital primary process. The mobius H₂O figure 8 DNA set represents reciprocal equilibrium of oscillating and intercoupling electrons generating hydrogen bonds within the H₂O molecule clusters that join 2 long chains of nucleotides twisted into a double-helix-Deoxyribo-Nucleic-Acid. This entwined synthesis of H₂O and DNA/RNA is naturally calibrated to polarize and align with Earth's morph-genic-electromagnetic field. (2 Peter 3:5) - "But they deliberately forget that long ago by (YHWH's) word the heavens came into being and the earth was formed out of water and by water." Genesis 1:2 "and the spirit of God was moving over the surface of the waters." How then do we navigate our journey through the nature of science, and what does the word of God say about it? Because the Creator is perfect and unchanging, his natural creation becomes a direct reflection of his invisible attributes. Genesis chapter 1 points out nine times the fact that all life was and is being created perfect and whole with the reproductive ability to multiply and perpetuate their own kind. DNA replication points the way back to our common ancestry, Genesis, as the origin of one human family a divine creation made in the image of our Father the Creator. "We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the Pursuit of Happiness." – Declaration of Independence. (accreditation): Great ideas stand on the shoulders of many great men, one such man is Michael Behe - (Biochemist) Professor of Biology who introduced the concept of irreducible complexity.
